## Sprint #2 Report

### **Actions to Stop Doing:**

Certain members feel that they have been tardy to meetings and are going to try to be on time to meetings instead of a couple minutes late. We have shortened our meeting times significantly and feel that we should make our meetings slightly longer than just doing Scrum as members had different ideas of the functionality of the app.

### **Actions to Start Doing:**

We need to sit down and do a merge together as some members are confused on how to merge using new Git branches. We should start focusing more on the task at hand instead of jumping around from one task to another. For example, at the end of a sprint meetings are longer and we tend to jump between working on the Sprint Report and the Sprint Plan instead of completing one and moving to the other.

### **Actions to Keep Doing:**

We improved from our previous sprint by not doing redundant work and not working on the same User Stories. We have gotten better at Scrum meetings and they have gotten more precise by answering the three questions:

1. What is stopping you from completing your task?
2. What do you hope to accomplish by the next meeting?
3. What have you completed since the last meeting?

### **Work Completed:**

We have a working local database using SQLite and are able to insert and delete entries from the database. The storyboarding of what the User Interface should look like has been completed so that everyone is now clear on what we expect to see in each activity. We are now able to store the time the user is going to bed when they set their alarm for the next morning. The theme of the app is now completed and is no longer the default theme.

### **Work Not Completed:**

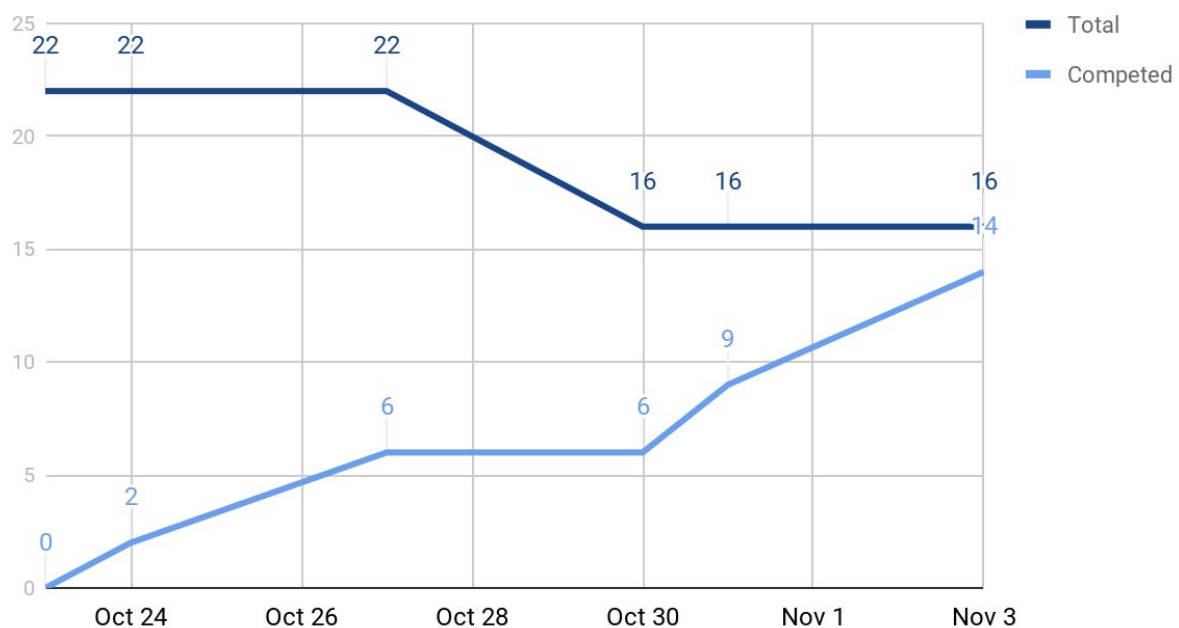

We still have not created our “done” criteria for the tasks which we need to do in order to be more efficient and consistent in what the completion of a task looks like. We also need to work on triggering a time input for when the user wakes up and not automatically assuming the

user wakes up when the alarm goes off (implementation of snooze/dismiss buttons). We are still working on the testing of the sound function of the alarm.

### Work Completion Rate:

We have currently completed 14/16 story points on our burnup chart. We reduced the number of story points from our original estimate of 22 points because we realized that we were adding tasks to User Stories that were not originally on the Sprint Plan. We completed 87.5% of what we had planned to accomplish this sprint. Our progress rate has significantly improved from our previous work completion rate of 33% from Sprint 1.
