<u>Sprint #1 Report</u>

<u>Actions to Stop Doing:</u>

We feel that we have been working on similar things so that has been very redundant and a lot of effort has been wasted. Instead we should split up the tasks to divide and conquer to better utilize our team. Our scheduling has also been a little disorganized, leading to confusion.

<u>Actions to Start Doing:</u>

Be more precise with Scrum. We go through the process, however we are doing a subpar job of sticking to time constraints and not being efficient with our time. If we start timing ourselves to keep ourselves on track, our time will be spent more efficiently and we will not need to spend as much of it.

<u>Actions to Keep Doing:</u>

We have been doing a good job in communicating with one another and being decisive about our objectives.

<u>Work Completed/Not Completed:</u>

In our release plan, we wanted to have a menu to set an alarm and have a functioning alarm that made a sound at the specified time by the end of the sprint. We are a little behind in our timetable. As predicted, the spike of getting familiarized with android studio and github has slowed the group's progress. We are just getting started on trying to make a functioning alarm. We all performed a demo on what we had completed and at the very least we all had an activity that could select a specified time using a timepicker. We don't have a menu yet and the alarm doesn't have a sound it makes upon completion.

<u>Work Completion Rate:</u>

Technically, the number of user stories we have completed is 1 so our work completion rate is 33%, however this number is quite misleading. Overcoming the learning curve with regards to android studio and github was challenging and it took up a lot of our time, but now that we have a better understanding of both our progress rate will significantly increase. There

are plenty of online resources that we can use in order to code what we want, so knowing how to use the software was probably our biggest challenge.
